

Elderly Falls Safety & Home Assessments

1/3 of adults 65+ experience falls!

In order to reduce falls, a clinical screening can keep people safer by referring them to helpful community resources.

Refer FREE Home Safety Assessments for adults 65+ living in your community!

This assessment will:

- Identify people who are at risk for falls
- Identify hazards in the home and connect people to resources.
- Reduce risks and keep people safe and independent in their homes.
- (See back for more details)

Falls Safety & Home Assessments

In the United States one in every three seniors over the age of 65 years fall each year and falls are the leading cause of injury, disability, nursing home placement, and death.

Falls Safety and Home Assessments are utilized to assess environmental risks within the home that can contribute to elderly falls and will properly identify patients who are at risk for falls, identify hazards in the home and connect the people to resources, and help reduce risks and keep people safe and independent in their homes.

If the individual is a home owner, they will be referred for home repair services .
